

FIRST STAGE IMPROVEMENTS

1.We included new feature called UI Scalling

- It involves responsive design techniques that adapt the layout based on the screen size and resolution. This include changing the size of text, buttons, images, and other interface elements to ensure they remain readable and accessible.

2. We improved connect database button which now gives you the option to also disconnect to the database.

3.We added a new button that saves the data from the text box to the disired location of the user as a csv file.The data saved can be further used for Data Analysis,interpretation or to make future predictions.

4.We used viewport Units: Using relative units (percentages) ,which allows to adjust font and size of features.
